Section:		Instructor:

Learning Objectives

At the end of this laboratory activity, students should be able to:

1. Create and run their first Python program
2. Use arithmetic operators in Python
3. Use comparison and logical operators
4. Understand assignment operators
5. Demonstrate simple logic in a Python program

STEP-BY-STEP GUIDE

Step 1: Open VSCODE, ***Create a new file and save it as: lab_1.py***
Python files must always end with the **.py extension**.
Things to Remember:
1. *Python File Naming: use* ***snake_case***
This is the standard naming convention in Python based on ***PEP 8****.*
lowercase_words_with_underscores.py
2. AVOID PascalCase *for file names, PascalCase is typically used for* ***class names****, not file names.*
3. AVOID camelCase*, camelCase is more common in JavaScript and Java, but not in Python.*
4. *In Python,* ***ALL CAPS is usually reserved for constants****.*
5. DO NOT use spaces *in file names.*
6. if, elif, and else *are* ***conditional statements*** *used when a program needs to* ***make decisions****.*
if *checks the first condition*
elif (else if) *checks another condition if the first one is false*
else *runs if none of the conditions are true*

Step 2: Write Your First Python Code

```
print("Hello, Welcome to Python!")
```

Step 3: Run the Program

In **VS Code**, you can Click **Run** or press **Ctrl + F5**

If using **Terminal**: *python* (space) filename.py

Laboratory 1

Guitar Store Purchase Calculator

Problem Scenario

You are planning to buy a new guitar from a music store.
The store sells different types of guitars and accessories. The program must compute the total purchase and determine if the buyer qualifies for a discount.

Task: Create a Python program that stores the following values:

- Guitar price
- Guitar type
- Number of accessories purchased
- Price per accessory
- Membership status

Program Output: The program should display:

```
C:\Users\Alai\Desktop\PythonTutorial>python sample_lab1.py
GUITAR STORE PURCHASE CALCULATOR
---------------------------------
Available Guitar Types and Price Ranges
1 - Acoustic (5000 - 9000)
2 - Electric (8000 - 15000)
3 - Bass (9000 - 18000)
Enter Guitar Type (Acoustic / Electric / Bass): Bass
Enter Guitar Price: 17999

Available Accessory Bundles
1 - Basic (Picks, Gig Bag) - 800
2 - Standard (Picks, Gig Bag, Tuner) - 1500
3 - Premium (Picks, Gig Bag, Tuner, Capo, Strap) - 2500
Choose bundle (1-3): 3

Are you a student? (yes/no): no
Are you a store member? (yes/no): yes
Are you a senior or PWD? (yes/no): no

----- PURCHASE SUMMARY -----
Guitar Type: Bass
Guitar Price: 17999.0
Accessory Bundle: Premium
Accessory Cost: 2500
Subtotal: 20499.0
Discount Percent: 20 %
Discount Amount: 4099.8
Final Amount: 16399.2
```

Programming Requirements: Your solution must use:

- Arithmetic operators
- Comparison operators
- Logical operators
- Conditional statements

Available Guitar Types and Price Ranges

The customer may choose one of the following guitar types:

Guitar Type	Price Range
Acoustic	5,000 to 9,000
Electric	8,000 to 15,000
Bass	9,000 to 18,000

Available Accessory Bundles

The customer may also choose an accessory bundle. **Choose one bundle only.**

Bundle	Included Items	Price
Basic	Picks, Gig Bag	800
Standard	Picks, Gig Bag, Tuner	1500
Premium	Picks, Gig Bag, Tuner, Capo, Strap	2500

Discount Rule

Discounts are applied based on the buyer's status:

Student	5%
Guitar Store Member	20%
PWD and Senior Citizen	10%

Note: If the buyer qualifies for **multiple discounts**, apply **only the highest discount**.

Save the program as: **section_surname_cal.py**
Attach the python file only (no need to zip)
